

## PREFACE

Research is very vital part in Academics. Academician publish their research work in form of research papers, articles, case studies, Monograph etc. Data analysis has a major role to play in research and researchers use various software and packages to do Data Analysis. Statistical Package for Social Sciences is one such package which researchers are using for data analysis. This Monograph demonstrates how one can use the statistical techniques to analyse the data using SPSS. This Monograph is an effort to present the concepts and techniques in a very simple manner.

Shiney Chib, Ph.D.
ABOUT THE AUTHOR:
Dr.Shiney Chib is working as Director \& Research Head with Datta Meghe Institute of
Management Studies, Nagpur. She is appointed as adjunct faculty with SEGI-University,
Malaysia. She has been conferred with 'Distinguished Educator Award' by 'Discovery
Education Media', 'Rajiv Gandhi Excellence Award in the field of Education' and
'Mahila Ratan Gold Medal for Academic Excellence' and 'Eminent Educationist
Award'. She has also received 'Academic Excellence Award' from NIPM Nagpur
chapter. Eight students have been awarded PhD under her guidance. She has industrial
experience of 11 years and 15 years of teaching experience. She has more than 100
publications, in the reputed journals, National and International conferences. She has
guided 12 Ph.Ds and authored 4 books. She has participated and chaired the conferences
held at Hamburg, Germany, Tokyo Japan and Hong Kong. She is a life member of NIPM,
NHRD, All India Commerce Association, Lion's Club International.

## Chapter 1

## Introduction to SPSS

SPSS (Statistical Package for Social Science) is a powerful and easy-to-use software program for data manipulation and data analyses. The advantages of SPSS is that it allows the researcher to manipulate and analyze data via syntax commands or through a visual data editor.

## Click START $\boldsymbol{-}$ ALL PROGRAMS- $\boldsymbol{-}$ SPSS Inc.- $\boldsymbol{-}$ SPSS 20.0

For New File creation:

## Click FILE $\rightarrow$ NEW $\rightarrow$ DATA

For Existing File:

## Click FILE $\rightarrow$ OPEN $\rightarrow$ DATA

You will get the results as shown below:

## GETTING FAMILIAR WITH SPSS

## > DATA AND VARAIBLE EDITOR:

For New File creation:

## OUT PUT WINDOW

## TOOLBAR

The TOOLBAR below Menu bar provides a quick and easy access to the different features.

- Open data document- $\rightarrow$ to open particular data file
- Save the document- $\rightarrow$ to save particular data file
- Print- $\rightarrow$ to print a particular data file
- Recall recently used dialogues- $\rightarrow$ shows a list of recently opened dialogue boxes, for easy and handy access. Undo a user action $-\rightarrow$ to undo user action
- Redo a user action- $\rightarrow$ to redo user action
- Goto case- $\rightarrow$ to go to a particular variable by directly typing the name of variable or selecting it from a drop down list.
- Goto variable- $\rightarrow$ to go to a particular variable by directly typing the name of variable or selecting it from a drop down list.
- Variables- $\rightarrow$ provide data definition for all the variable in the current data file.
- Find $-\rightarrow$ to search particular data in the existing data editor.
- Insert cases- $\rightarrow$ to insert a case above the active cell case.
- Insert variable- $\rightarrow$ to insert a variable to the left of active cell variable.
- Split File- $\rightarrow$ to split a file into separate groups.
- Weigh Cases- $\rightarrow$ to give different weighs to cases for statistical Analysis.
- Select Cases- $\rightarrow$ to select varied criteria to be used in case selection. It provides several methods for selecting groups/sub groups of cases based on some criterion.
- Value Label- $\rightarrow$ It allows toggling between value labels and actual values in the Data Editor.
- Use Variable Sets->used to select particular sets of variables in the current data file.
- Show all variable- $\rightarrow$ used to see all variables in the current data file.
- Spell Check- - used to check spelling in the current data file.

## > MENU BAR

The features of main MENU bar are as follows:

| File |
| :---: |

## FILE MENU

The FILE MENU allows creating new files, opening existing files, read text data, save files, print and other basic starting or output activities. You can exit SPSS through this menu. This menu resembles the FILE MENU features of Ms-word.

## EDIT MENU

The EDIT MENU allows to cut,copy, paste from the output or windows clipboard. It also allows to redo/undo any action. You can also inert/goto variable or case through this Menu.

## VIEW MENU

The VIEW menu allows to activate/deactivate the status bar and other toolbars. You can change fonts, grid lines, value label.

| View | Data | Transform | Analyze | Direc |
| :---: | :---: | :---: | :---: | :---: |
|  | Status Bar |  |  |  |
|  | Toolbars |  |  |  |
|  | Menu Editor... |  |  |  |
|  | Fonts. |  |  |  |
| $\checkmark$ Grid Lines |  |  |  |  |
| $\square$ 1 A Value Labels |  |  |  |  |
| $\square$ Mark Imputed Data |  |  |  |  |
| - Customize Variable View... |  |  |  |  |
| 閣 Variables |  |  | $\mathrm{Ctrl}+\mathrm{T}$ |  |

## DATA MENU

The DATA Menu allows you to define variable properties, dates, multiple response sets. It also allows in identifying duplicate cases, sorting cases/variables, transposing, restructuring and aggregating data along with other functions. You can also merge files, split a file, select and weigh cases through this menu.

International Journal of Scientific and Research Publications（ISSN：2250－3153）

## TRANSFORM MENU

TRANSFORM menu allows creating new variables using compute variable and helps in changing variables in the data file through recode，rank case and many others．

| Transform Analyze Direct Marketing | Graphs |
| :---: | :---: |
| Compute Variable．．． <br> Count Values within Cases．．． Shift Values．．． |  |
| Recode into Same Variables．．． <br> Recode into Different Variables．．． <br> Automatic Recode．．． <br> 陨 Visual Binning．．． <br> 艮。 Optimal Binning．．． <br> Prepare Data for Modeling | － |
| 閉 Rank Cases．．． |  |
| Date and Time Wizard．．． Create Time Series．．． Replace Missing Values．．． Random Number Generators．．． |  |
| －Run Pending Transforms |  |

## ANALYZE MENU

ANALYZE menu allows the analysis of data label based on various statistical tools and techniques.

| Analyze Direct Marketing |
| :--- |
| Geports |
| Descriptive Statistics |
| Tables |
| Compare Means |
| General Linear Model |
| Generalized Linear Models |
| Mixed Models |
| Correlate |

| Dimension Reduction |
| Scale |
| Nonparametric Tests |
| Forecasting |
| Survival |
| Multiple Response |
| Missing Value Analysis... |
| Multiple Imputation |
| Complex Samples |
| Quality Control |
| ROC Curve... |
| IBM SPSS Amos... |

## GRAPHS MENU

The GRAPH menu allows you to create bar chart, line chart area chart, pie chart, histogram, scatter plots along with many other variations.

## UTILITIES MENU

The UTILITIES menu helps in using various other utilities, which may or may not be required in normal usage. This menu shows data file comments, allows define or use different variable sets and spell check.

| $\underline{\text { Utilities Add-ons Window }}$ | H |
| :---: | :---: |
| Variables... <br> OMS Control Panel... <br> OMS Identifiers... |  |
| Scoring Wizard... <br> Merge Model XML... |  |
| $\Omega$ Data File Comments... |  |
| 謁 Define Variable Sets... Use Variable Sets... Show All Variables |  |
| Sta Spelling... |  |
| ED Run Script... |  |
| Production Facility... <br> Map Conversion Utility... |  |
| Custom Dialogs | - |
| Extension Bundles | - |

## ADD-0NS MENU

The ADD-ONS menu provides a list of various add-on features requisite for special requirements and are mostly meant for advanced level users.

| Add-ons Window Help |
| :--- |
| Applications |
| Services |
| Programmability Extension |
| Statistics Guides |

## WINDOWS MENU

The WINDOWS Menu allows you to arrange, select and control the attributes of various windows. Through this menu, you can easily split a window, minimize all windows or switch over between the various open windows.

## HELP MENU

The HELP Menu allows you to access the information related to usage of various features of SPSS.

## > CREATING A DATA FILE

## EXAMPLE DEMONSTRATION.

Lets discuss the data file creation. A close ended questionnaire is defined for knowing the consumer preference with respect to mobile phones. The questions were: Age , Gender, Qualification, Occupation, Monthly Income, Residence, Mobile Brand Preference.

## DEFINING VARAIBLES:

In order to define variables based on questionnaire, following points need to be taken into consideration:

- Must begin with a letter.
- Cannot end with full stop or underscore.
- Must be unique; duplication not allowed.
- Blanks and special characters cannot be used.
- Length of name cannot exceed 64 bytes.
- Reserve key words (like AND,ALL,NOT,OR TO, WITH) cannot be used as variable names.
- Names are not case sensitive. They can be written in upper or lower case.
- Long variable names need to wrap to multiple lines in the output, so SPSS attempts to break lines at underscore, periods and a change from lower to upper case.

## VARIABLE TYPE

You can select variable type according to your requirement. By default numeric variable type with eight width and 2 decimal is chosen by SPSS. You can also change the width and decimal places.

## MOBILE PHONE---BRAND PREFERENCE

1. AGE: 1)Below 30 2)30-35 3)35-40 4)40-45
5) 45-50
6)Above 50
2. GENDER : 1) Male 2)Female
3. QUALIFICATION:1)Under graduate 2)Graduate 3)Post Graduate 4)MPhil 5) PhD .
4. OCCUPATION : Student( ) Business ( ) Service ( ) Others ( )
5. MONTHLY INCOME : Less than 20000 ( ) 20000-30000 ( ) 30000-40000 ( ) Above 50000( )
6. RESIDENCE : Metro ( ) Non-Metro( ) Rural ( )
7. MOBILE BRAND PREFERENCE : IPHONE ( ) SAMSUNG ( ) BLACKBERRY ( ) SONY ( ) OTHERS( )

## CODE BOOK

| SR.NO. | VARIABLE NAME | VALUE/CODE |
| :---: | :---: | :---: |
| 1 | AGE | $\begin{aligned} & 1=<30 \\ & 2=30-35 \\ & 3=35-40 \\ & 4=40-45 \\ & 5=45-50 \\ & 6=>50 \end{aligned}$ |
| 2 | GENDER | $\begin{aligned} & \text { 1=MALE } \\ & \text { 2=FEMALE } \end{aligned}$ |
| 3 | QUALIFICATION | $\begin{aligned} & 1=\text { UNDER GRADUATE } \\ & 2=\text { GRADUATE } \\ & 3=\text { POST GRADUATE } \\ & 4=\mathrm{MPHIL} \\ & 5=\mathrm{PHD} \end{aligned}$ |
| $4$ | OCCUPATION | $\begin{aligned} & 1=\text { STUDENT } \\ & 2=\text { BUSINESS } \\ & 3=\text { SERVICE } \\ & 4=\text { OTHER } \end{aligned}$ |
| 5 | MONTHLY INCOME | $\begin{aligned} & 1=<20000 \\ & 2=20000-30000 \\ & 3=30000-40000 \\ & 4=40000-50000 \end{aligned}$ |

|  |  | $5=>50000$ |
| :---: | :---: | :---: |
| 6 | RESIDENCE | 1=METRO |
|  |  | 2=NON METRO |
|  |  | 3=RURAL |
| 7 | MOBILE BRAND PREFERENCE | 1=IPHONE |
|  |  | 2=SAMSUNG |
|  |  | $3=$ BLACKBERRY |
|  |  | 4=KA |
|  |  | 5=SONY |
|  |  | 6=0THERS |

## SUMMARY:

- For New File creation: Click FILE $\rightarrow$ NEW $\rightarrow$ DATA
- In case of defining variables you must take care of naming, labels, variable type, column format and measurement level.
- Once entries are made, you can save the data file. Just click FILE Menu- $\rightarrow$ Save and click will open the save data as dialogue box. Enter the name of file, choose the location to save the file and press save.
- For Existing File:Click FILE $\rightarrow$ OPEN $\rightarrow$ DATA

## EXERCISE

Create a data file with the following variable and their information.

| Sr.No. | Variable Name | Information |
| :---: | :---: | :--- |
| 1. | Gender | Male |
|  |  | Female |
| 2. | Age | Below 20 |
|  |  | $20-30$ |

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

## Chapter 2

## Descriptive Statistics

Descriptive statistics are used to have a basic view of the data, i.e. to describe the data, like how many respondents were there, how may male, how many female, the average age range, what is the median salary etc.

## Frequency Distributions:

There are display of the frequency of occurrence of each value. The frequency distribution can be represented in tabular or graphical form

- For continuous variable with ratio/interval scales, histogram or frequency polygons may be used.
- For categorical variables with nominal/ordinal scales, bar chats can be used.
- Measures of Central Tendency
- The measures are mainly useful with interval or ratio scales.
- There are three main measures of central tendency, that is mean, median and mode.
- The measures of variability include range, interquartile range, standard deviation and variance.

## WORKING EXAMPLE:

Lets discuss descriptive statistics with a working example.

| Sr.No. | Variable Name | Information |
| :---: | :---: | :--- |
| 1. | Gender | Male |
|  |  | Female |
| 2. | Age | Below 20 |
|  |  | $20-30$ |
|  |  | $30-40$ |
|  |  | $40-50$ |

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

|  |  | Above 50 |
| :--- | :--- | :--- |
| 3. | Education | Under graduate <br> Graduate <br> Post graduate <br> Doctorate |
| 4. | occupation | Student <br> Business <br> Service <br> others |
| 5. | Monthly salary | Less than 30000 <br> $30000-40000$ <br> $40000-50000$ <br> Above 50000 |
|  |  |  |
|  |  |  |
|  |  |  |

Form the data file and enter the data as shown below

We are ready to analyze the data and see the descriptive statistics. The frequency distribution display the frequency of occurrence of each score value. This can be represented in tabular and graphical form. In case of continuous variables (measured on ratio or interval scale) histogram or frequency polygon are appropriate. In case of categorical variables (measured on nominal or ordinal scale) bar charts are suitable. Main measures of central tendency are mean, median and mode. The measures of variability include range, interquartile range, standard deviation and variance. These measures of variability are more suitable for interval or ratio data.

In order to the analysis:

## Click Analyze $\rightarrow$ Descriptive Statistics $\rightarrow$ Frequencies

This will open Frequencies dialogue box.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

Select the variable you wish to compute. In order to select a variable,
click on that variable in left side box $\rightarrow$ click the right arrow button between the two boxes $\rightarrow$ the variable will shift to the right side in Variables list box

Similarly do this for all the variables.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

Now click Statistics button: a sub dialogue box will appear on the screen. Click check box, as desired. In this working example, we have selected various statistics based on the following figure. After selecting click continue. The sub dialogue box will be closed and previous dialogue box will reappear.

Click Charts button to open its sub dialogue box. Click the radio buttons, as desired. In this working example we have selected radio button based on the following figure.

After selection click continue. The sub dialogue box will be closed and previous dialogue box will reappear. In this dialogue box click OK to open the Output viewer.

Select the variables, you wish to compute. In this working example we have selected all the five variables. In order to select a variable, click on that variable in left side box $\rightarrow$ click the Right Arrow button between the two boxes. The variable will shift to the right side in Variables list. Similarly, do this for all other variables. Now click 'Save Standardized values as variable' check box to save the standardized z-scores for further computation (like interaction terms in multiple regression) or in comparing samples from different population.

Now click Options button to open its sub dialogue box. Click the check boxes, as desired. After selection click continue.

Calculate descriptive statistics. Draw pie chart for each observation. Test the Normality, using Histogram.

## Chapter 3

## Transforming Data

Windows can transform the values in several ways. SPSS for Windows can:
$>$ Combine values of a variable into several categories,
$>$ Create new variables out of old variables,
$>$ Select particular cases and analyze only these cases,
$>$ Weight cases so that some cases count more heavily than others.
SPSS provides many ways to transform data: recode, compute, if, and weight.

## Recoding Variables

Recoding is a way of combining the values of a variable into fewer categories. Let me give a hypothetical example. Let's say you have conducted a survey and one of your demographic questions was the age of the respondent. Entering the actual age in years would be the simplest way of working with the data. But let's also say that you want to compare people of different age groupings. In other words, your data would be more useful if it was organized into collapsed categories, like "Young", "Middle age", and "Older". Using SPSS for Windows you could reorganize the data so that you had these three groupings. There are two things you need to know before you recode the values.

- First, you need to decide the number of categories you want to end up with.
- Generally this will be determined by the way you plan to use the information.

If you are going to analyze the data using a table where you cross-tabulate two variables, you probably want to limit the number of new categories to three or four. The second thing you need to know is which of the old values are going to be combined into a new category. For example, you might do something like this.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

| The actual age of the respondent <br> originally recorded in the data file. | The new, collapsed, category. |
| :--- | :--- |
| 18 years through 35 years | Young |
| 36 years through 55 years | Middle age |
| 56 years of age or over | Older |

Another example might be if respondents were asked how often they prayed, and the original responses were several times a day, once a day, several times a week, once a week, less than once a week, once a month, once a year, or never. With recode we can combine the people who said "several times a day" with the people who said "once a day" and put all these respondents into a new category which we could call "a lot". Similarly, we could combine the people who said "several times a week" with those who said "once a week" and call this category "sometimes" and combine those who said "less than once a week" and "once a month" and call this category "infrequently". Those who said "once a year" or "never" could be combined into a fourth category called "hardly ever". Recoding is the process in SPSS that will do the above examples.

## WORKING EXAMPLE :

Please note that in the below table,

| 1 | First column indicates the respondent number |
| ---: | :--- |
| 2 | Second column indicates the preference for fast food. The respondents <br> were asked to state their preference for fast food on a 5-point scale where <br> $1=$ not at all preferred, 2 = not preferred, 3 = neutral, 4 = preferred, 5 = <br> very much preferred. |
| 3 | Third column in the table indicates the actual age of the respondent |
| 4 | Fourth column of the table states the household monthly income coded as: <br> $1=$ Household income less than Rs.25,000/- per month (low income) <br> $2=$ Household income of Rs.25,000/- per month but less than Rs.50,000/- <br> per month (middle income) <br> $3=$ Household income of Rs.50,000/- \& above (High income) |
| 5 | Fifth column <br> $1=$ Male <br> $2=$ Female |

## Data Table:

## DATA VIEW

Click on＂Transform＂$\rightarrow$＂Recode＂．

Your screen will look like:

Now we have two options:"Recode Into Different Variables" and "Recode Into Same Variables".It is strongly suggested to use the "Recording Into Different Variables" option. If you make an error, your original variable is still in the file and you can try again. If you make an error using "Recode Into the Same Variables", you have changed the original variable. If you also saved the file after doing this, and you did not have another copy of the file, you have just eliminated any chance of correcting your error.

## Recoding Into Different Variables

The recoding into a different variable starts with giving the new variable a variable name.
For example, Lets take 'Preference'
If we recode into different variables we could combine the preference like
Not at all preferred=code 1, Not preferred=code 2, Neutral = code 3 as New variable-Not preferred as code $=1$.

Preferred=code 4, Very much preferred=code 5 preferred as code=2.
To do that, click on "Into Different Variables". Your screen will look like:

Find 'Preference' in the list of variables on the left and click on it to highlight it, and then click on the arrow just to the left of the big box in the middle of the window. This will move Preference into the list of variables to recode. You want to give a name to this new variable so click in the "Name" box under Output Variable and type the name "Preference1" in this box. You can even type a variable label for this new variable in the Label box just below the Name box. Try typing "Age in Four Categories" as your label. Click on the "Change" button to tell SPSS to make these changes. Your screen will look like as below.

Now we have to tell SPSS how to create these categories. Click on the "Old and New Values" button at the bottom of the window. The screen will look like:

There are several options. You can change a particular value into a new value by entering the value to be changed into the Old Value box and the new value into the New Value box and then clicking on Add. You will usually change one "real" value to another "real" value .For example, change 1 thru 3 into value 1.There are also other options. You can also change a range of values into a new value and that is what we are going to do. Click on the fourth bubble from the top labeled "Range". Notice how this marks this choice by filling in the bubble. Then type "1" (the youngest value in the data set) in the box to the left of "through", click on the box to the right of through, and type " 3 " in that box. Then click on "Value" just below New Value and type "1" in that box. This will have SPSS combine all preferences from 1 through 3 into a single category and give it the value of 1 . Then click on "Add". Now do the same thing for the other categories. Click on the box under Range and type "4" in the box to the left of "through", click on the box to the right of through, and type " 5 " in that box. Click on "Value" just below New Value and type " 2 " in that box and click on Add.

International Journal of Scientific and Research Publications（ISSN：2250－3153）

| Data View | Variable View |
| :--- | :--- |

To change one of your categories, highlight that category in the Old?> New box and make the changes, then click on "Change". The new category should appear in the Old?>New box. To remove a category, highlight it and click on "Remove".

Now we want SPSS to carry out the recoding. Click on "Continue" at the bottom of the window. This will take you back to the "Recode into Different Variables" box. Click on "OK" and SPSS will take a few seconds to carry out your commands. The data matrix should appear on the screen. When it says that the SPSS Processor is Ready at the bottom of the window you know that SPSS has finished with the recoding.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

Click on "Analyze", then point your mouse at "Descriptive Statistics", and then click on "Frequencies". Notice that Prefernce1 has appeared in the list of variables on the left.

## Chapter 3

## T-TEST

## BASIC ASSUMPTIONS FOR ALL T TESTS:

1. Scale of measurement-interval or ratio scale.
2. Random Sampling-data should be randomly sampled.
3. Population normality-data is numerical data representing samples from normally distributed populations.

## WORKING EXAMPLE:

Bharat Petroleum stocks has two kinds of petrol. ' Normal Petrol' and 'Speed Petrol'. 30 two wheelers were tested with Normal Petrol and with Speed Petrol. The two wheelers were having either 'Self-start' or 'Kick-start'.

Two wheeler coding:1(Manual), 2(Automatic)
The earlier trail shows that mean number of Kilometer per litre was 14.

## Questions:

1. Whether second trail efficiency of two wheeler is better than the previous trail?
2. Whether efficiency of engine improves with 'Speed Petrol'?
3. Whether efficiency of engine with speed petrol and normal petrol differs between self start and kick start?

T Test using SPSS.

Enter the data as shown in the table below.

| Two-wheeler <br> Type | Speed- <br> petrol | Normal- <br> Petrol |

## > T TEST WITH ONE SAMPLE

This test is used when data from a single sample is there and when you want to know whether the mean of population from which sample is drawn is same as the hypothesised mean.

Click Analyze $\rightarrow$ Compare Means $\boldsymbol{\rightarrow}$ One sample $\mathbf{T}$ test.......This will open One Sample $\mathbf{T}$ Test dialogue box.

Select the test variable and click Right Arrow button to shift the variable in Test Variable list. Change the Test Value to 14 , as in the working example it is 12 . Click $\mathbf{O K}$ to see the Output Viewer.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

OUT PUT
One-Sample Statistics

|  | N | Mean | Std. Deviation | Std. Error Mean |
| :---: | :---: | :---: | :---: | :---: |
| SPEEDPETROL | 30 | 19.3667 | 4.35085 | .79435 |

The above table shows the mean and standard deviation values of one sample $t$ test along with standard error mean.

## One-Sample Test

|  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | t | df | Sig. (2- <br> tailed) | Mean <br> Difference | 95\% Confidence Interval of <br> the Difference |  |
|  |  |  |  |  | Lower | Upper |
| SPEEDPETROL | 6.756 | 29 | .000 | 5.36667 | 3.7420 | 6.9913 |

The value of two tail significance is less than $0.05(\mathrm{p}<0.05)$, as such the difference between means is significant. The output data indicates that there is a significant difference in engine efficiency between the previous and current trail. The two wheeler in the current trail have more engine efficiency than those in earlier trial with $\mathrm{t}(29)=6.756, \mathrm{p}<0.05$.

## > T TEST WITH MORE THAN ONE SAMPLE:

This test is used to ask whether two sets of values are random samples from same or different populations.

- If they are random samples from same population, then any differences across conditions or groups can be attributed to random sampling variability.
- If two sets of values are random samples from different populations, then you can attribute any difference between means across condition to the independent variable.

## > REPEATED MEASURES T-TEST(DEPENDENT SAMPLES/ PAIRED T-TESTS)

This test is used when you have data from one group of participants that individual obtains two values under different levels of the independent variable.

## Additional Assumptions:

1. Normality of population difference value-the difference between the values for each respondent should be normally distributed. The sample size is not too small (30+).

Click Analyze $\rightarrow$ Compare Means $\rightarrow$ Paired Sample T Tests.......This will open Paired Sample T Test dialogue box.

Select the paired variables according to your requirement. In this example Normal Petrol and Speed Petrol are paired variables. Send the paired variables in the Paired Variables list box as shown in the figure below. Click $\mathbf{O K}$ to see the output viewer.

## OUT PUT

Paired Samples Statistics

|  |  | Mean | N | Std. Deviation | Std. Error Mean |
| :--- | :--- | ---: | ---: | ---: | ---: |
| Pair 1 | SPEEDPETROL | 19.3667 | 30 | 4.35085 | .79435 |
|  | NORMALPETROL | 17.6500 | 30 | 2.83801 | .51815 |

The table shows paired sample statistics of with Normal Petrol and Speed Petrol responses.

Paired Samples Correlations

|  |  | N | Correlation | Sig. |
| :--- | :--- | ---: | :--- | :--- |
| Pair 1 <br> NORMALPETROL |  | 30 |  |  |

The table above shows the paired sample correlations with correlation value of $0.544, \mathrm{p}<0.05$.

Paired Samples Test

|  |  | Paired Differences |  |  |  |  | t | df | Sig. (2- <br> tailed) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Mean | Std. <br> Deviation | Std. Error Mean | 95\% Confidence Interval of the Difference |  |  |  |  |
|  |  | Lower |  |  | Upper |  |  |  |
| Pair 1 | SPEEDPETROL NORMALPETROL |  | $\begin{array}{r} 1.716 \\ 67 \end{array}$ | 3.68053 | .67197 | . 34234 | 3.09100 | 2.555 | 29 | . 016 |

The value of two tail significance is less than $0.05(\mathrm{p}<0.05)$ ，as such the difference between mean is significant．The output indicates there is a significant difference in the engine efficiency between Speed Petrol and Normal Petrol trail．The two wheelers with speed petrol have more engine efficiency than those with，Normal Petrol with t（29）＝2．555， $\mathrm{p}<0.05$ ．

## ＞INDEPENDENT GROUPS T－TEST

This test is appropriate when respondent in one condition are different from respondents in other condition．This is commonly referred to as between subject design．

## Additional Assumptions：

－Independence of Groups－respondent should appear in only one group and these groups should be unrelated．
－Homogeneity of variance－The variance of groups should be similar．
To check normality assumption：
Click Analyze $\Rightarrow$ Descriptive Statistics $\Rightarrow$ Explore．．．．．．This will open Explore dialogue box．

The Levene's test in Speed Petrol shows probability greater than 0.05 , that is 0.383 , which says that population variance is relatively equal. The two tail significance for speed petrol shows that $\mathrm{p}>0.05$ and therefore is not significant. We can say that two groups come from same population since no significant difference exist $-t(28)=1.727, p>0.05$. This can also said as Null Hypothesis. No Significant difference exist in two wheelers types in case of speed petrol.

The Levene's test in Normal Petrol shows probability greater than 0.05 , that is 0.377 , which says that population variance are relatively equal. The two tail significance for speed petrol shows that $\mathrm{p}>0.05$ and therefore is not significant. We can say that two groups come from same population since no significant difference exist $\mathrm{t}(28)=1.019, \mathrm{p}>0.05$. This can also said as Null Hypothesis. No Significant difference exist in two wheelers types in case of Normal petrol.

## EXERCISE:

'Talent Hunt' Soft skill training institute has conducted QUIZ1 and QUIZ2 on General awareness. In total 25 students appeared for the same.

Student -GENDER coding:1(MALE), 2(FEMALE)
The earlier mean was 36.
Questions:

1. Whether Quiz 2 was better than QUIZ 1.
2. Whether the score has improved in QUIZ2?
3. Whether there is difference in score between MALE \& FEMALE Gender.

## Chapter 5

## Correlation and Regression Analysis

Correlation coefficient summarizes and quantifies the relationship between two variables in a single number and it is denoted by small letter ' $r$ '. This number range from -1 to $+1 .-1$ represents a perfect negative or inverse relationship to 0 representing no relationship or complete independence to +1 representing a perfect positive or direct relationship. When we calculate a coefficient correlation fro sample data, we need to see whether it is having positive, negative and no relation. Scatter plot helps to examine the nature of relationship. Sometimes correlation is low not because of a lack of relationship but because of a lack of linear relationship. In such case, examining the scatter plot will assist in finding whether the relationship may be non linear.

Steps for calculating correlation:
Analyze $\rightarrow$ correlate $\rightarrow$ Bivariate.....

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

## > WORKING EXAMPLE:

Table shows the data of sales department. Distribution cost is given in thousands. Check whether any correlation exist between distribution cost , order placed and actual sales.

**. Correlation is significant at the 0.01 level ( 2 -tailed).
The bivariate correlation is undertaken between the respondents. it was hypothesized that a relationship exists between Distribution cost and order placed, distribution cost and actual sales. The above result shows that there exist the correlation. Distribution cost and Orders placed the correlation ratio ' $r$ ' is 0.918 , which shows that both are highly correlated. Distribution cost and Actual Sales correlation ratio ' $r$ ' is 0.871 , which shows that both are highly correlated. And p<0.05 in both the cases.

Click Options...button to open Options sub dialogue box. Select the options accordingly. Click continue to get the output.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

## REGRESSION

In Linear regression, we are finding the equation of a straight line that best fits the observation. We can use the line to predict a value of $Y$ for any value of X . This line will have an intercept term and a slope coefficient and is represented as:

$$
Y=a+b X
$$

Lets use the same example for regression also.
Click Analyze $\rightarrow$ Regression $\rightarrow$ Linear..... this will open Linear Regression Dialouge box.

Select the dependent variable as 'Distribution cost' and send it to Dependent list box. Select 'orders placed' as independent variable and send it to independent variable.

Click Statistics...button to open its sub dialogue box. Select the required statistics as shown in the figure below. Click Continue to close sub dialogue box. Previous dialogue box will reappear.

Collinearity Diagnostics ${ }^{\text {a }}$

| Model | Dimension | Eigenvalue | Condition Index | Variance Proportions |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | (Constant) | order placed | Actual Sales |
| 1 | 1 | 2.979 | 1.000 | . 00 | . 00 | . 00 |
|  | 2 | . 017 | 13.413 | . 99 | . 07 | . 10 |
|  | 3 | . 005 | 25.302 | . 00 | . 93 | . 90 |

a. Dependent Variable: Dist Cost

The collinearity diagnostics indicate a low degree of overlap between the predictors. If two predictor variables were orthogonal (uncorrelated), the variance inflation factor for each would be 1 . Thus we can say that there is no problem of collinearity in this case.

|  | Residuals Statisticsa |  |  |  |  |
| :--- | ---: | ---: | :---: | ---: | ---: |
|  | Minimum | Maximum | Mean | Std. Deviation | N |
| Predicted Value | 49.0069 | 93.9277 | 71.2414 | 12.14031 | 24 |
| Residual | -9.95979 | 7.60913 | .00000 | 4.45200 | 24 |
| Std. Predicted Value | -1.831 | 1.869 | .000 | 1.000 | 24 |
| Std. Residual | -2.138 | 1.633 | .000 | .956 | 24 |

a. Dependent Variable: Dist Cost

The histogram of the standardized residual shows that the departure from normality is not too severe.

The normal P-P plot indicates some departure from normality and may suggest a curvilinear relationship between the predictors and the criterion.

The plot of the standardized predicted values against the standardized residuals indicates a large degree of heteroscedasticity.

## WORKING EXAMPLE:

A survey is conducted in order to find the preference criteria of a popular brand of ice cream. Responses were collected in 7 point Likert scale. Preferences were measured with respect to its nutrition value, flavor and presentation.

Find whether there is any relation between preferences and its nutrition value, flavor and presentation. Perform Single regression and multiple regression analysis and interpret your answers.

## Chapter 6

#### Abstract

ANOVA

ANOVA is used when you want to compare means of more than two groups or level of an independent variable. ANOVA test comes under parametric and it satisfies the following assumptions.

- Data is numerical data representing normally distributed populations.
- The variance of groups are similar.
- Sizes of group are similar.
- The groups should be independent.

ANOVA tests the null hypothesis that means of all the groups being compared are equal and produces a statistics called $F$. if the mean of all the groups tested by ANOVA are equal, then null hypothesis is proved. In case of the rejection of null hypothesis, we perform Brown-Forsythe and Welch test in SPSS.

Homogeneity of variance :If significance value is less than 0.05 , variances of groups are significantly different.

Brown-Forsythe and Welch test : :If significance value is less than 0.05 , reject null hypothesis.
ANOVA: :If significance value is less than 0.05 , reject null hypothesis.
Post-Hoc analysis are used to protect against type I errors, given that all the possible comparisons are going to be made. Some of the Post-Hoc tests are:

- Scheffe test-allows every possible comparison to be made but is tough on rejecting the null hypothesis.
- Tukey test/honestly significant difference(HSD) test-lenient but the types of comparison that can be made are restricted.
> One Way ANOVA:

## WORKING EXAMPLE:

Excellence coaching centre want to compare the competitive exam score of its registered students from 5 different centers namely, Ramnagar, Gandhinagar, SBI square, Azad Nagar and Civil Lines . 10 score based on random sampling from each centre has been taken as sample for study. Note that the sample is independent sample as they belong to the different study centre.

1 =Ramnagar, 2=Gandhinagar, 3= SBI square, 4=Azad Nagar and 5=Civil Lines.

Null Hypothesis: There is no significant difference in scores from different study centers.
Alternate Hypothesis:There is significant difference in scores from the different study centers.

## Descriptives

|  | N | Mean | Std. Deviation | Std. Error | 95\% Confidence Interval for Mean |  | Minimum | Maximum |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | Lower Bound | Upper Bound |  |  |
| 1 | 10 | 389.70 | 87.347 | 27.622 | 327.22 | 452.18 | 269 | 499 |
| 2 | 10 | 440.70 | 97.855 | 30.944 | 370.70 | 510.70 | 300 | 599 |
| 3 | 10 | 396.00 | 65.137 | 20.598 | 349.40 | 442.60 | 298 | 488 |
| 4 | 10 | 375.20 | 59.299 | 18.752 | 332.78 | 417.62 | 295 | 450 |
| 5 | 10 | 505.00 | 90.126 | 28.500 | 440.53 | 569.47 | 299 | 599 |
| Total | 50 | 421.32 | 91.389 | 12.924 | 395.35 | 447.29 | 269 | 599 |

Test of Homogeneity of Variances
Score

| Levene Statistic | df1 | df2 | Sig. |
| ---: | :---: | :---: | :---: |
| .868 |  | 4 | 45 |

Since homogeneity of variance should not be there for conducting ANOVA tests, which is one of the assumption of ANOVA, we see that Levene's test shows that homogeneity of variance is not significant ( $\mathrm{p}>0.05$ ). the population variance for each group are approximately equal.

## International Journal of Scientific and Research Publications (ISSN: 2250-3153)

## ANOVA

Score

|  | Sum of Squares | df | Mean Square | F | Sig. |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Between Groups | 111459.080 | 4 | 27864.770 | 4.211 | .006 |
| Within Groups | 297783.800 | 45 | 6617.418 |  |  |
| Total | 409242.880 | 49 |  |  |  |

Table shows the F test value along with the degrees of freedom and significance is 0.006 , you can reject the null hypothesis and accept the alternate hypothesis. That is there is significant difference in scores from the different study centers. $\mathrm{F}=4.211, \mathrm{p}<0.05$.

| Civil Lines | 10 |  | .405 |
| Sig. |  | .386 |  |

Means for groups in homogeneous subsets are displayed.
a. Uses Harmonic Mean Sample Size $=10.000$.

## > TWO WAY ANOVA

Two way ANOVA is similar to one way ANOVA, except in this case additional independent variable is introduced and each independent variable includes two or more variants.

## WORKING EXAMPLE:

Pinnacle Marketing Research firm wants to conduct a study to find whether Sales of the respondent depends upon territory and qualification. 13 sales people were considered from each territory and each respondent can select three education levels.

Territory : Gandhinagar=1,Cosmos Town=2 and Sadar=3.
Qualification: Under graduate $=1$, Graduate $=2$ and post graduate $=3$.
A total of $3 \times 3 \times 13=117$ responses were collected.
Research Questions:
Whether territory influences sales?
Education influences sales?

| Sr.No. | Territory | Qualification | Sales |  | Sr.No. | Territory | Qualification | Sales |

Levene's Test of Equality of Error Variances ${ }^{\text {a }}$
Dependent Variable: Sales

| F | df1 | df2 | Sig. |
| :---: | :---: | :---: | :---: |
| .662 | 8 | 30 | .720 |

Tests the null hypothesis that the error variance of the dependent variable is equal across groups.
a. Design: Intercept + Territory + Qualification + Territory * Qualification

The Levene's test shows that homogeneity of assumption has not been violated, since p> 0.05 , i.e. main effects of territory and qualification are not significant. Therefore neither territory nor qualification influences the sales by respondents.

a. R Squared $=.733$ (Adjusted R Squared $=.662$ )
b. Computed using alpha $=.05$

The above table shows that, qualification level shows significant effect on sales with $\mathrm{p}<$ $0.05 \mathrm{~F}=30.885, \mathrm{p}<0.05$. The output also shows that neither territory nor territory and qualification combined have significant interaction effect on sales with both having $p>0.05$. We can also say that, territory does not influence sales, $\mathrm{F}=2.384, \mathrm{p}>0.05$. Also territory and qualification both does not collectively influence sales, $\mathrm{F}=158.979$, $\mathrm{p}>0.05$.

## Chapter 7

## Factor Analysis

Factor Analysis is a statistical process used to analyze interrelationships among a large number of variables and to explain these variables in terms of their common underlying factors. The objective is to condense the information contained in a larger number of variable into a smaller set of variables. Factor analysis is a generic name given to a class of multivariate statistical methods whose primary purpose is to define the underlying structure in a data matrix. Broadly speaking it addresses the problem of analyzing the structure of interrelationships (correlations) among a large number of variables. Once these dimensions and the explanation of each variable are determined, the two primary uses for factor analysis-summarization and data reduction can be achieved (Hair et al.,1998)

## Step 1: objectives of Factor Analysis

The first step involves

## > Identifying structure through data summarization

Factor analysis can identify the structure of relationship among either variables or respondents by examining either the correlation between the variables or the correlation between the respondents. The most common type of factor analysis is referred to as R factor analysis. R factor analysis analyses a set of variables to identify the dimension that are latent (not easily observed). But if factor analysis be applied to a correlation matrix of the individual respondents based on their characteristics then it would be referred to as Q factor analysis, which is a method of converting a large number of people into distinctly different groups within a large population.

## $>$ Data reduction

Factor analysis can also :Identify representative variables from a much larger set of variables for use in subsequent multivariate analyses, Or, Create an entirely new set of variables, much smaller in number, to partially or completely replace the original set of variables for inclusion in subsequent techniques. In both the cases the objective is to retain the nature and character of the original variables, but reduce their number to simplify the subsequent multivariate analysis(Hair et al.,1998)

## Step 2:Designing Factor Analysis.

Hair et al., (1998) mentioned that the design of a factor analysis involves three basic decisions:

- Calculation of input data (a correlation matrix) to meet the specified objectives of grouping variables or respondents.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

- The design of the study in terms of number of variables, measurement properties of variables, and the types of allowable variables; and
- Sample size necessary, both in absolute terms and as a function of number of variables in the analysis.

## Step 3: Assumptions in Factor Analysis :

Sample size : a sample of 100 subjects is acceptable.
Normality : variables should be normally distributed.
Linearity :linearity should be present since correlation are required.
Overall significance of correlation matrix should be checked with Bartlett test of sphericity and KMO measure of Sampling Adequacy.

## Step 4: Deriving Factors and Assessing Overall Fit

Hair et.al.(1998) mention that once the variables are specified and the correlation matrix is prepared, then factor analysis can be applied to identify the underlying structure of relationships. In doing so, decisions must be made concerning

- The method of extracting the factors ; common factors analysis versus component analysis)
- The number of factors selected to represent the underlying structure in the data.

Component analysis to used when the objective is to summarize most of the original information in minimum number of factors for prediction purpose. When a large set of variables is factored, the method first extracts the combination of variables explaining the greatest amount of variance and then proceed to combination of variables explaining the greatest amount of variance and then proceed to combinations that account for smaller amounts of variance.

For extracting the number of factors the latent root criterion has been used. According to Hair et al.,(1998), the latent root criterion is most commonly used technique and its rational is that any individual factor should account for the variance of at least single variable if it is to be retained for interpretation. Each variable contributes a value of 1 to the total eigenvalue. Only the factors having latent root or eigenvalues greater than 1 are considered significant ;all factors with latent root less than 1 are considered insignificant and are disregarded. Another criteria for the number of factor to extract is the percentage of variance criterion which according to Hair et al.,(1998) is an approach based on achieving a specified cumulative percentage of total variance extracted by successive factors. The purpose is to ensure practical significance for the derived factors by ensuring that they explain at least a specified amount of variance. The scree test is derived by plotting the latent roots against the number of factors in their order of extraction and the shape of the resulting curve is used to evaluate the cutoff point. Therefore, single criterion
named latent root as a guideline for determining how many factors to extract as the first attempt at interpretation and also a scree test to complete determination.

## Step 5: Interpreting the Factors

Hair et al.(1998) explain the three steps are involved in the interpretation of the factors and the selection of the final factor solution. The initial unrotated factor matrix is computed to assist in obtaining a preliminary indication of the number of factors extract. The factor matrix contains factor loadings for each variable on each factor. In computing the unrotated factor matrix, the best linear combination of variables is expected. Therefore , the first factor may be viewed as the single best summary of linear relationship exhibited in the data. The second factor is defined as the second-best liner combination of the variables; subject to the constraint it is orthogonal to the first factor. To be orthogonal to the first factor, the second factor must be derived from the variance remaining after the first factor has been extracted.

Factor loading is the means of interpreting the role each variable plays in defining each factor. Factor loadings are the correlation of each variable and the factor. Loadings indicate the degree of correspondence between the variable and the factor, with higher loadings making the variable representative of the factor. The unrotated factor solution may not provide a meaningful pattern of variable loadings. Generally, rotation will be desirable because it simplifies the factor structure and it is usually difficult to determine whether unrotated factors will be meaningful. Therefore the second step employs a rotation method to achieve simpler and theoretically more meaningful factor solutions (Hair et al.,1998). In the third step, we assess the need to specify the factor model owing to;

- Deletion of variables from the analysis
- The desire to employ a different rotational method for interpretation
- The need to extract a different number of factors
- The desire to change from one extraction method to another.

Re-specification of a factor model is accomplished by returning to the extraction stage, extracting factors, and interpreting them again(Hair et al.,1998)

According to Hair et al. (1998) three major orthogonal approaches have been developed
QUARTIMAX: the ultimate goal of a QUARTIMAX rotation is to simplify the rows of a factor matrix ; that is QUATRIMAX focuses on rotating the initial factor so that a variable loads high on one factor and as low as possible on all other factors.

VARIMAX: VARIMAX criterion centres on simplifying columns of the factor matrix. With the VARIMAX rotational approach, the maximum possible simplification is reached if there are only 1 s and 0 s in a column.

EQUIMAX: the EQUIMAX approach is a compromise between the QUARIMAX and VARIMAX approaches. Rather than concentrating either on simplification of the rows or on simplification of the columns, it tries to accomplish some of each.

In selecting among the above mentioned rotational methods for the research, there is a point to mention that no specific rules have been developed to guide the researcher in selecting a particular orthogonal or oblique rotational technique. In the working example we intend to utilize the rotational technique VARIMAX as the orthogonal solution for the analysis of existing variable.

## > WORKING EXAMPLE:

The researcher wants to conduct factor analysis on the factors affecting the employee satisfaction.

Eleven variables were considered for conducting factor analysis. He conducted analysis based on the rating: strongly disagree(1), disagree(2), Neutral (3) ,Agree (4), Strongly agree (5)

Make a data file based on the eleven factors as shown in the figure below:

| Respondents | Var | Var | Var | Var | Var | Var | Var | Var | Var | Var | Var |

Click Analyze - Dimension Reduction Factor.......
This will open Factor Analysis dialogue box.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

Click the variable in the left list box and send it in Variables list box by clicking upper right arrow button. Similarly do this for other variables. Click Descriptives... button to open its sub dialogue box and select the desired statistics as well as correlation matrix properties according to your need. In the working example, we have selected KMO and Barlett's test of sphericity as well as Anti-image in the correlation matrix. Click Continue button to close the sub dialogue box. The previous dialogue box will reappear.

Click Extraction.... Button to open its sub dialogue box. Select the method as principal components. You can also change other extraction methods and options as per you need. In the working example, we have selected the following extraction options. Click Continue button to close the sub dialogue box. The previous dialogue box will reappear.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

Click Rotation ... button to open its sub dialogue box. Select the method as Varimax and in Display select the check box of Rotated solution. Click Continue button to close the sub dialogue box. The previous dialogue box will reappear.

International Journal of Scientific and Research Publications (ISSN: 2250-3153)

Click Scores... button to open its sub dialogue box. select the scores according to your need. Click Continue button to close the sub dialogue box. The previous dialogue box will reappear.

Click Options...button to open its sub dialogue box. Select the options according to your need. Click Continue button to close the sub dialogue box. The previous dialogue box will reappear. Click Ok to see the output viewer.

## $>$ EXERCISE

80 Respondents were surveyed based on 15 variables with a rating scale of :
Strongly disagree-1, Disagree-2, Neutral-3, Agree-4, Strongly Agree-5.
Conduct a factor analysis based on the following data table and conclude the results of output.

| Respondents | Var $1$ | Var <br> 2 | Var <br> 3 | Var 4 | Var 5 | Var $6$ | Var 7 | Var $8$ | Var $9$ | Var $10$ | Var $11$ | $\begin{array}{r} \text { Var } \\ 12 \\ \hline \end{array}$ | Var $13$ | Var $14$ | Var $15$ |
